

C-115 ⇒ Structures in C using typedef

* How to define a structure using type def keyword?

* What is typedef keyword?

typedef :-

* It is used to create your own datatype (or) synonym of your original name.

Eg: Jayanthi or Jerry.

```
typedef int integer;
```

→ Using typedef we have allowed the original datatype name 'int' to integer.

```
Ex: typedef int integer;
      main()
      {
```

```
        int a = 10; ✓
```

```
        integer b = 15; ✓
```

correct
using
typedef

* This typedef we can also use this with structure.

In structure; every time we want to write the "struct student" for creating object/variable for structure datatype.

Ex: struct student

```
{
    int rollno;
    char name[20];
    float marks;
}
```

```
void main()
{
```

```
    struct student S1 = {10, "Jerry", 90};
    printf("%d %s %f", S1.rollno, S1.name, S1.marks);
}
```

→ struct student S2;

we can avoid writing struct student every time by using typedef.

Ex: typedef struct student

```
{
    int rollno;
    char name name[20];
    float marks;
}
```

Student;

name changed

```
void main()
{
```

Student S = {10, "Jerry", 89};

```
printf("%d %s %f", S.rollno, S.name, S.marks);
}
```

instead of struct student datatype name we changed the datatype name to student

* This is only datatype; so it won't have memory space.

* Both are datatype only but we changed the name; and the changed name is not permanent for all programs; scope of name change will exist only where it is used within the program.

* It also defined globally and locally inside the program.

Ex (1) typedef int integer; → global declaration

```

main()
{
  ---; use here
}

void sum()
{
  ---; use here
}
  
```

Ex (2) main()

```

{
  ---
  integer a = 10;
}
  
```

Cannot use here

void sum()

```

{
  typedef int integer;
  integer a = 10;
}
  
```

can use here
because local to sum()

```

1  #include <stdio.h>
2  #include <stdlib.h>
3  /** 17-Structures in C using typedef **/
4  typedef struct student
5  {
6      int rollno;
7      char name[20];
8      float marks;
9  } student;
10 int main()
11 {
12     typedef int integer;
13     integer a=6;
14     printf("%d\n",a);
15     student s;
16     printf("Enter details of students\n");
17     scanf("%d %s %f",&s.rollno,&s.name,&s.marks);
18     printf("%d %s %0.2f",s.rollno,s.name,s.marks);
19     getch();
20 }
21

```
