C-128 → ftell() function in File Handling:

* As a name suggest, ftell() will tell the position of file pointer in the file.

* When we open a file, the file pointer will be at the starting point of file and when we use ftell() function, it will return position of file pointer is in 0th index.

* Now using fseek() when we moved the file pointer and now using ftell() we can get the current position of the pointer. Eg: 6th index.

* Application of ftell() will tell out also the length of the file.

```
FILE *fp = NULL;  
char ch; int pos;  
char str[50];  
fp = fopen("abc.txt", "r");
```

```
if (fp == NULL)
```

```
{  
    printf("Error in opening file");  
    exit(1);  
}
```

return type
of file pointer

(SYNTAX: long int ftell(FILE *pointer);)

eg ① pos = ftell(fp);
printf("%d", pos);
fclose(fp); ⇒ ⑥

* Now pos will return 0; tells that pointer is in 0th index of the file.

eg ②

abc.txt										
0	1	2	3	4	5	6	7	8	9	10
J	e	n	n	y		k	h	a	t	r

↑

pos = ftell(fp);
printf("%d", pos);

fseek(fp, 5, SEEK_SET);
printf("%d", ftell(fp)); ⇒ ⑥

eg ③

abc.txt

0	1	2	3	4	5	6	7	8	9	10
J	e	n	n	y		k	h	a	t	r

↑ ↑

pos = ftell(fp);
printf("%d", pos); ⇒ ⑥

fseek(fp, 5, SEEK_SET);
printf("%d", ftell(fp)); ⇒ ⑥

ch = fgetc(fp);

printf("%c", ch); ⇒ print space
bcoz at 5th

printf("%d", ftell(fp));

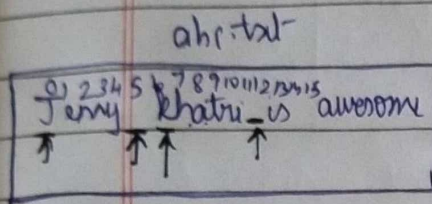

↓
⑥

NOTE (X)

After pointing
space i.e. we
read & after
reading pointer
is moved to next
position

Eg: ④ pos = ftell(fp);
printf("%d", pos); ⇒ ⑥

fseek(fp, 5, SEEK_SET);
printf("%d", ftell(fp)); ⇒ ⑤

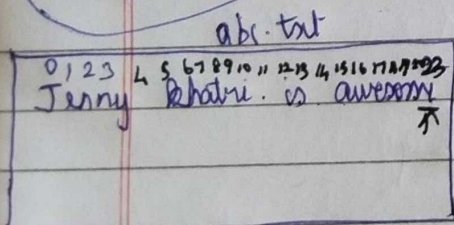

~~character~~
ch = fgetc(ch);
printf("%c", ch); ⇒ Space

printf("%d", ftell(fp)); ⇒ ⑥

fscanf(fp, "%s", str);
printf("%s", str); ⇒ Khatri

printf("%d", ftell(fp)); ⇒ ⑫

get a string space considered are not in %s ;
You can also try with fgets() function and see what output you get when printing str

Eg: ⑤ FILE *fp;
char ch; int pos;
char str[50];
fp = fopen("abc.txt", "r");
if (fp == NULL)

printf("Can't open file");
exit(1);

3
offset 0 so pointer will remain at end.

fseek(fp, 0, SEEK_END); ⇒ To point position of file pointer

printf("%d", ftell(fp)); ⇒ ⑫

which tells the length of file
