

# C-07 $\Rightarrow$ Constants in C

## Constants:

Value won't change in the program.

## Types of Constants:

## Decimal Constants:

\* 0 - 9 ; base 10

Eg: 5, 1, 10, ...

## Octal Constants:

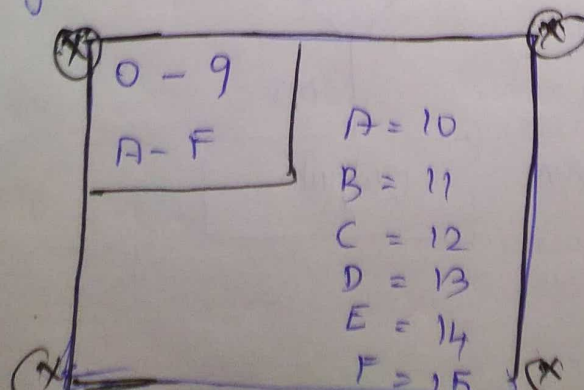

\* 0 - 7 ; base 8

Eg: 05 (preceded by 0)

## Hexadecimal Constants:

\* 0 - 9 and A - F ; base 16.

Eg: 0X74 or 0x74 (preceded by 0X)

Eg. 0X7F ✓

0X7G ✗

9123 ✗

123 ✓

+1234 ✓

-1234 ✓

56, 100 ✗

## Floating / Real Constants:

Eg. +12.56

↓ ↓  
real fractional  
part part

-12.56 ✓

12.56.57 ✗

## Single character Constant:

Eg. 'a', 'S', '%', '9', '@'

\* These character constants are stored in the computer in the form of ASCII codes.

\* 'a' = 97 ; 'A' = 65  
'b' = 98 ; 'B' = 66

ASCII code for  
A starts from 65

\* 5 ≠ '5'

printf("%d", 'a'); → 97

printf("%c", 97); → a

A-Z = 65-90  
a-z = 97-122  
0-9 = 48-57  
Special = 32-47, 58-64, 91-96

## String constants:

"Jenny", "abc", "ab\$", "12345"

$"a" \neq 'a'$   
↓                      ↓  
String                  Character

$"1" \neq '1'$

"Jenny10"

↳ Length of string is 6

## Const Keyword:

g: void main()

{

const int a = 10;

} a = 50; → ~~error~~ (read only value)

\* Because we declared const for value of a, so we cannot change value of a.

\* If const keyword not there, then we can change the value of variable a.

\* We can also use #define NAME VALUE
